- Suppresses weeds
- Retains nutrients

Ratings

Suppresses Weeds

Retains Nutrients

Improves Soil Structure

A rapid growing crop that produces a large amount of biomass.

It is club root tolerant, has the ability to reduce nematodes and is also an excellent weed suppressor.

It produces a long aggressive taproot that penetrates through many different soils types, improving drainage and air movement through the soil.

A major benefit is that it captures and stores nutrients from deep in the soil over the winter period, which are released in the spring for the next crop.

It can provide much needed cover throughout the winter months for game birds or can be used as an excellent fast growing, nutrient storing green manure crop.

Seed Rate	Pack Size	S
8 - 10kg/ha	5 & 25kg	U
