

Pea, Barley & Oats

Arable Silage Mixtures offer an alternative or additional feed to grass or maize silage and are particularly suitable for farmers wishing to increase their levels of home-produced protein and reduce their reliance on purchased feed and fertiliser.

They produce a cost-effective, high quality forage of consistent quality and palatability, with high yields of dry matter even in dry seasons and cold weather. They can be selfed from the silage-face or as bales and their early harvest allows for earlier drilling of other autumn combinable crops or reseedling of grass.
